

18.747: Problem set 6; due Thursday, October 17

1. Prove formula 9.14b in Kac-Raina.
2. Let  $\mathcal{F} = \bigoplus \mathcal{F}^{(m)}$  be the semiinfinite wedge space.
  - (a) Show that  $\mathcal{F}$  is an irreducible representation of the Clifford algebra generated by  $\hat{v}_j, \hat{v}_j^*$ .
  - (b) Compute  $Tr_{\mathcal{F}}(q^{\mathbf{d}}z^{\mathbf{m}})$ , where  $\mathbf{d}$  is the operator multiplying homogeneous elements by their degree, defined by  $deg(\psi_0) = 0, deg(\hat{v}_j) = j, deg(\hat{v}_j^*) = -j$ , and  $\mathbf{m}$  is the operator which acts by multiplication by the number  $m$  on  $\mathcal{F}^{(m)}$ .
3. Using the fact that  $\mathcal{F} = \mathcal{B}$ , compute the answer to problem 2 using the bosonic realization. Deduce that

$$\prod_{n \geq 0} (1 - q^n z)(1 - q^{n+1} z^{-1})(1 - q^{n+1}) = \sum_{m \in \mathbb{Z}} (-z)^m q^{m(m-1)/2}$$

(Jacobi triple product identity). Substitute  $z = q^{1/3}$  and obtain Euler's pentagonal identity for  $\prod_{n \geq 1} (1 - p^n)$ .

4. Let  $\hat{\mathfrak{g}}$  be the affine Lie algebra associated to a simple Lie algebra  $\mathfrak{g}$ . Let  $a \in \mathfrak{g}$  and  $a(z) = \sum a[n]z^{-n-1}, a[n] = at^n \in \hat{\mathfrak{g}}$ .
  - (a) Show that if  $V$  is a highest weight representation of  $\hat{\mathfrak{g}}$  then  $a(z)$  defines a linear map  $V \rightarrow V((z))$  (here  $V((z))$  is the space of formal Laurent series with coefficients in  $V$ ).
  - (b) Let  $V$  have a highest weight vector  $v$  with  $hv = 0$  for  $h$  in the Cartan subalgebra of  $\mathfrak{g}$ , and  $Kv = kv$ . Compute  $\langle v, a(z_1)b(z_2)v \rangle$  (as a rational function).
  - (c) Compute  $\langle v, a(z_1)b(z_2)c(z_3)v \rangle$ .
